THE PERUVIAN AMAZON

- Over 90% of malaria in the Western Hemisphere is located in the Amazon
- In Peru, 75% of malaria cases occur in the Department of Loreto, in the Northern Amazonian Region, and most cases (80%) are concentrated in just 10 of the department's 51 districts.
- Key factors related to continued malaria endemicity:
 - expansion of vector habitats from land use change (deforestation for logging and road development)
 - social and ecological processes that increase human exposure *Anopheles darlingi*

AIMS

Feasibility Study: develop a spatially explicit model of malaria transmission risk on the basis of predicted *Anopheles* density and mapped human settlement and activity patterns

End application: operational risk monitoring system to inform decisions on resource distribution and vector management by our collaborators (PRISMA, State Health Ministry, US NMRCD)

MALARIA IN PERU

Reported Malaria, Loreto Province 1990-2011

Highest Deforestation Rate in Peru

Iquitos-Nauta Road Paving &
Fujimori logging concessions

**Roll Back Malaria
& Amazon Malaria Initiative**

2nd highest increase in malaria cases
among Amazon-Basin countries

MALARIA ON THE AMAZON FRONTIER

MALARIA ON THE AMAZON FRONTIER

MALARIA ON THE AMAZON FRONTIER

APPROACH

- Spatio-temporal Ecological *Anopheles* model
 - Input 1: Satellite-based land cover maps
 - Input 2: Meteorological data
 - Input 3: Land Data Assimilation System
- Human Activities and Settlements Map
 - Input 1: Satellite and *in situ* mapping
 - Input 2: Census and Economic data
- Eco-epidemiological Malaria Transmission Model
 - Application: Risk monitoring and prediction

STATE OF ANALYSIS

- Land Surface Model simulations show strong potential to inform predictions of *Anopheles* distribution.
- The relationship between land cover and mosquito distribution is robust and species-specific, and it appears to be strongest at 3-8km radius of influence.
- Climate variability appears to affect total mosquito abundance, while land cover influences the relative density of vector species. Infection rates now being introduced to the model.
- Individual and population scale malaria risk modeling: LDAS / climate variables currently being integrated with epidemiologic surveillance data.

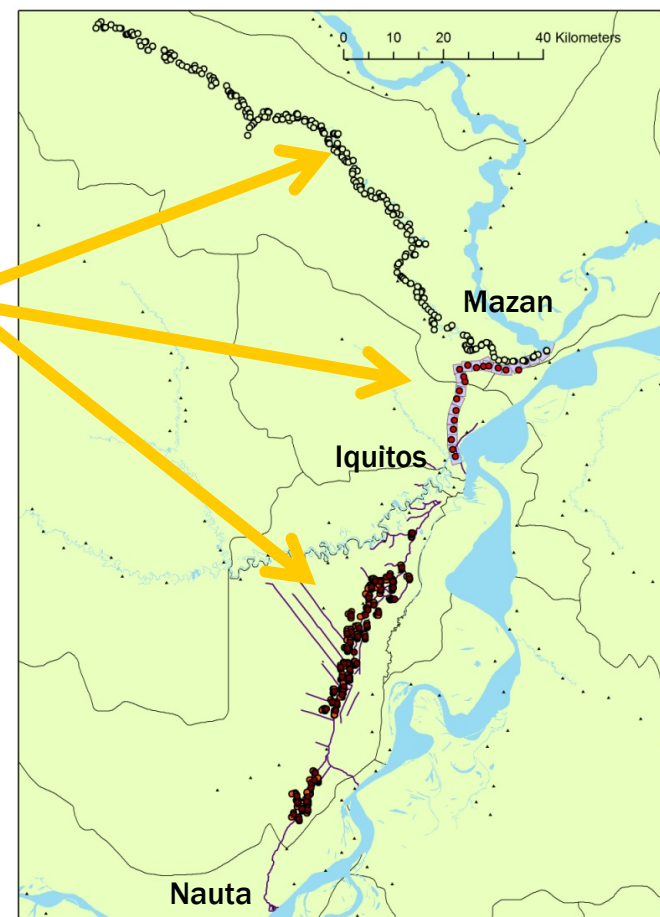

Ecological modeling geographic location

ANOPHELES COLLECTIONS

Mosquito Collection

- Iquitos-Nauta road: 1999-2001
- Iquitos-Mazan road: 2007-2011
- Additional survey of logging camps

LAND COVER CHANGE

- **Deforestation & Infrastructure Expansion**
 - Oil Exploration
 - Highway construction
 - Urban growth
- 12 class supervised classification on Landsat
- Nauta-Iquitos road in 2001 and Iquitos-Mazan road in 2009
- Deforestation/reforestation was quantified through comparisons with earlier images

SPATIALLY EXPLICIT *ANOPHELES* MODEL

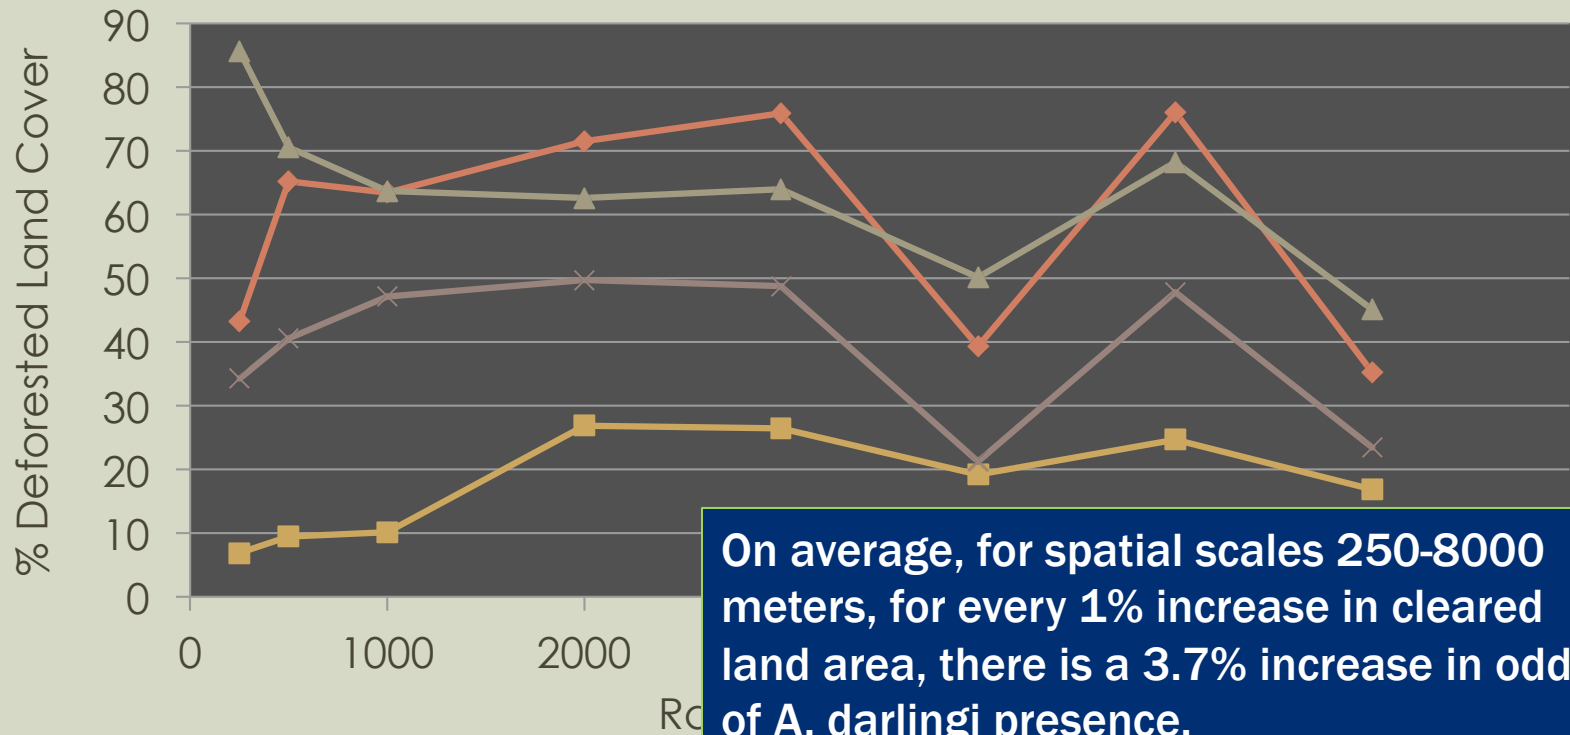

250 m radius

1000 m radius

SPATIALLY EXPLICIT ANOPHELES MODEL

Deforestation vs. Scale

On average, for spatial scales 250-8000 meters, for every 1% increase in cleared land area, there is a 3.7% increase in odds of *A. darlingi* presence.

Water bodies

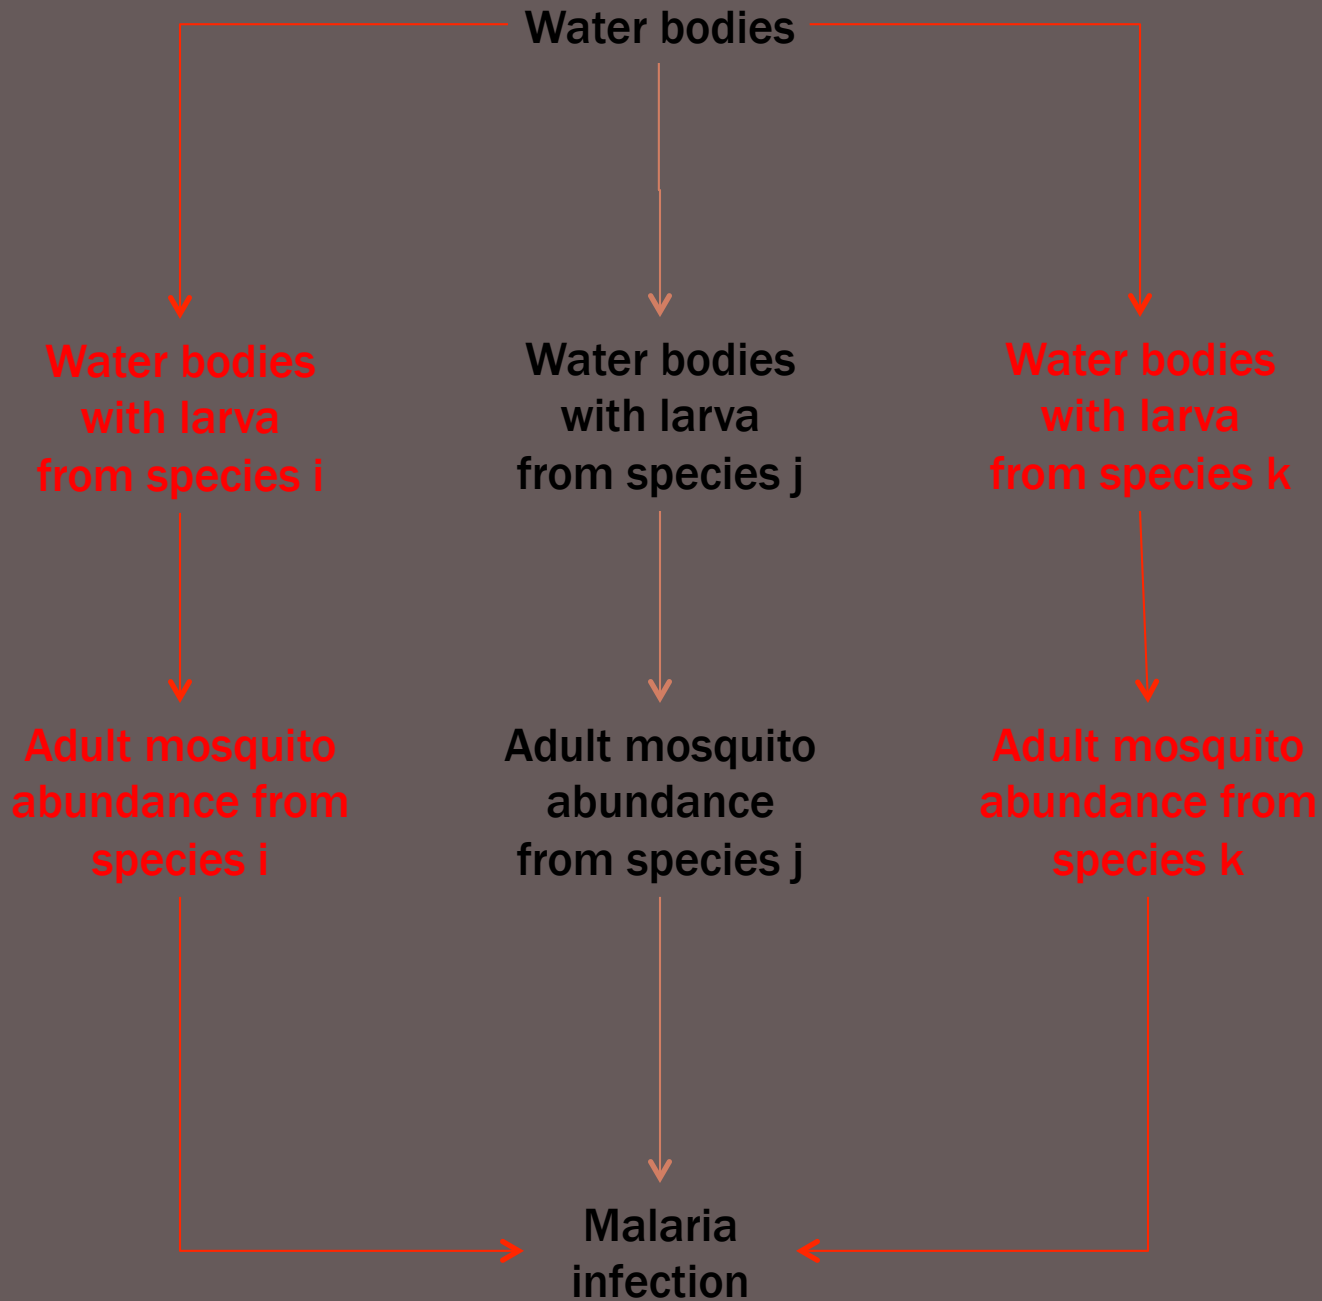

**Water bodies

Forest area

Water area

Solar radiation

NFV area

Min. Temp. (5d avg)

1) Land use variables have much greater impact on larva presence than the climate variables do.

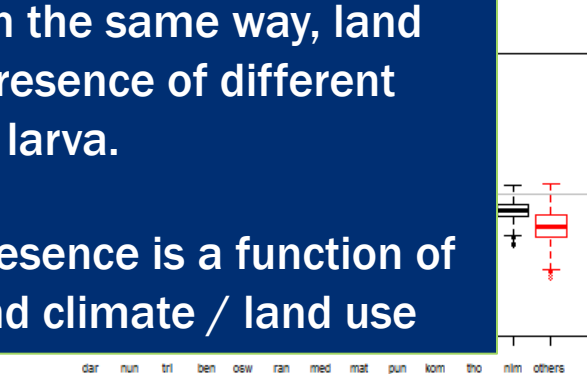

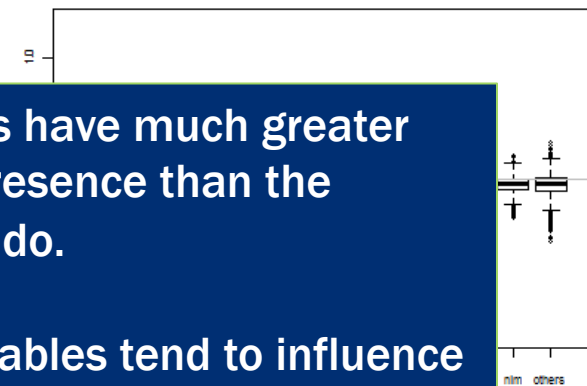

2) While climate variables tend to influence all species types in the same way, land use predicts the presence of different types of mosquito larva.

3) Adult mosquito presence is a function of larval presence and climate / land use

Urban area

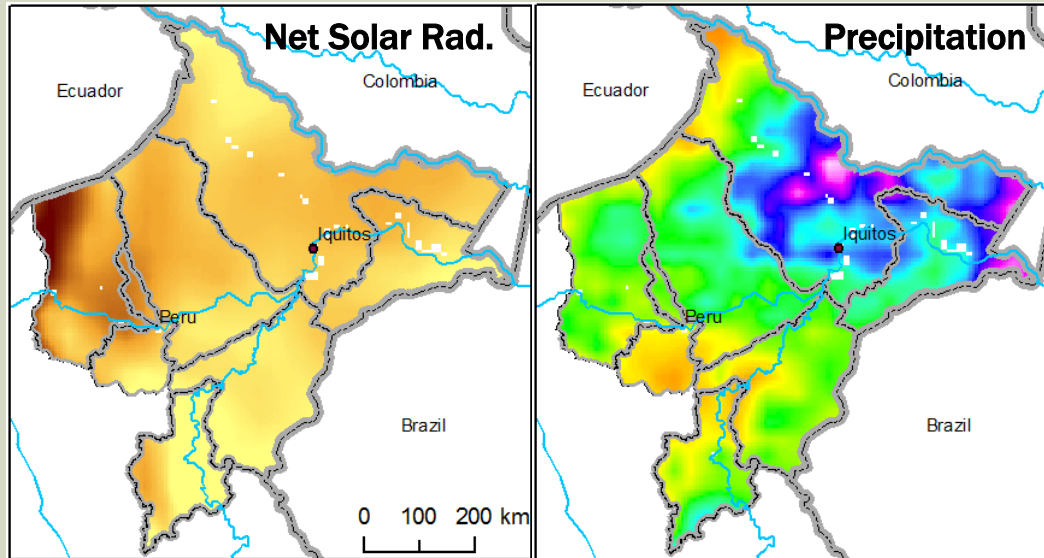

Precipitation

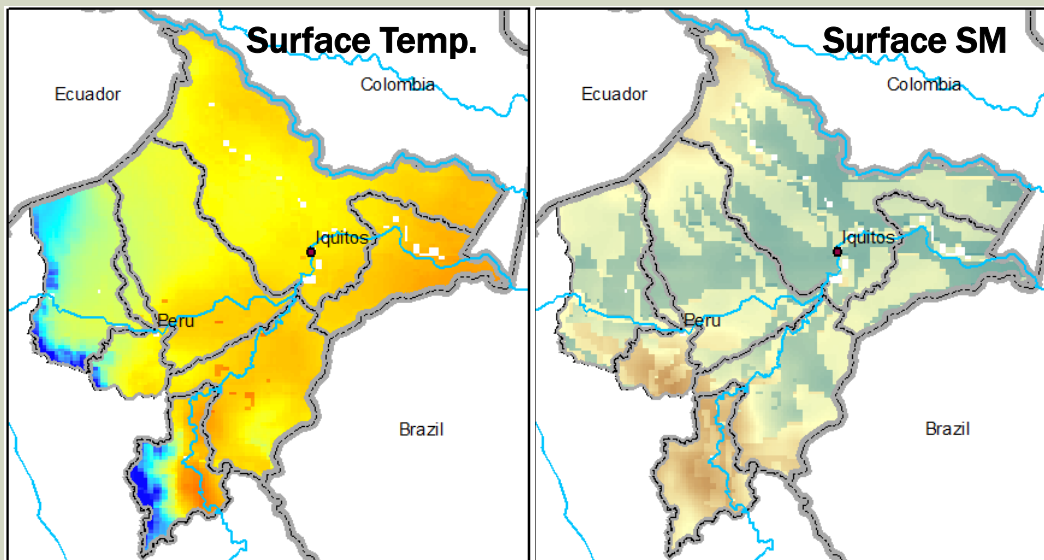

POPULATION LEVEL MODELING

- We are coupling the individual analysis with complementary population level analysis.
- Inputs:
 - Epidemiologic surveillance data for 2000-2012 from the Regional Health Directorate.
 - LDAS/climate variables for each malaria case
 - MODIS land cover products
- Model:
 - Expected number of cases per health post per week is dependent upon local temperature, precipitation, soil moisture, season, population density and human migration.

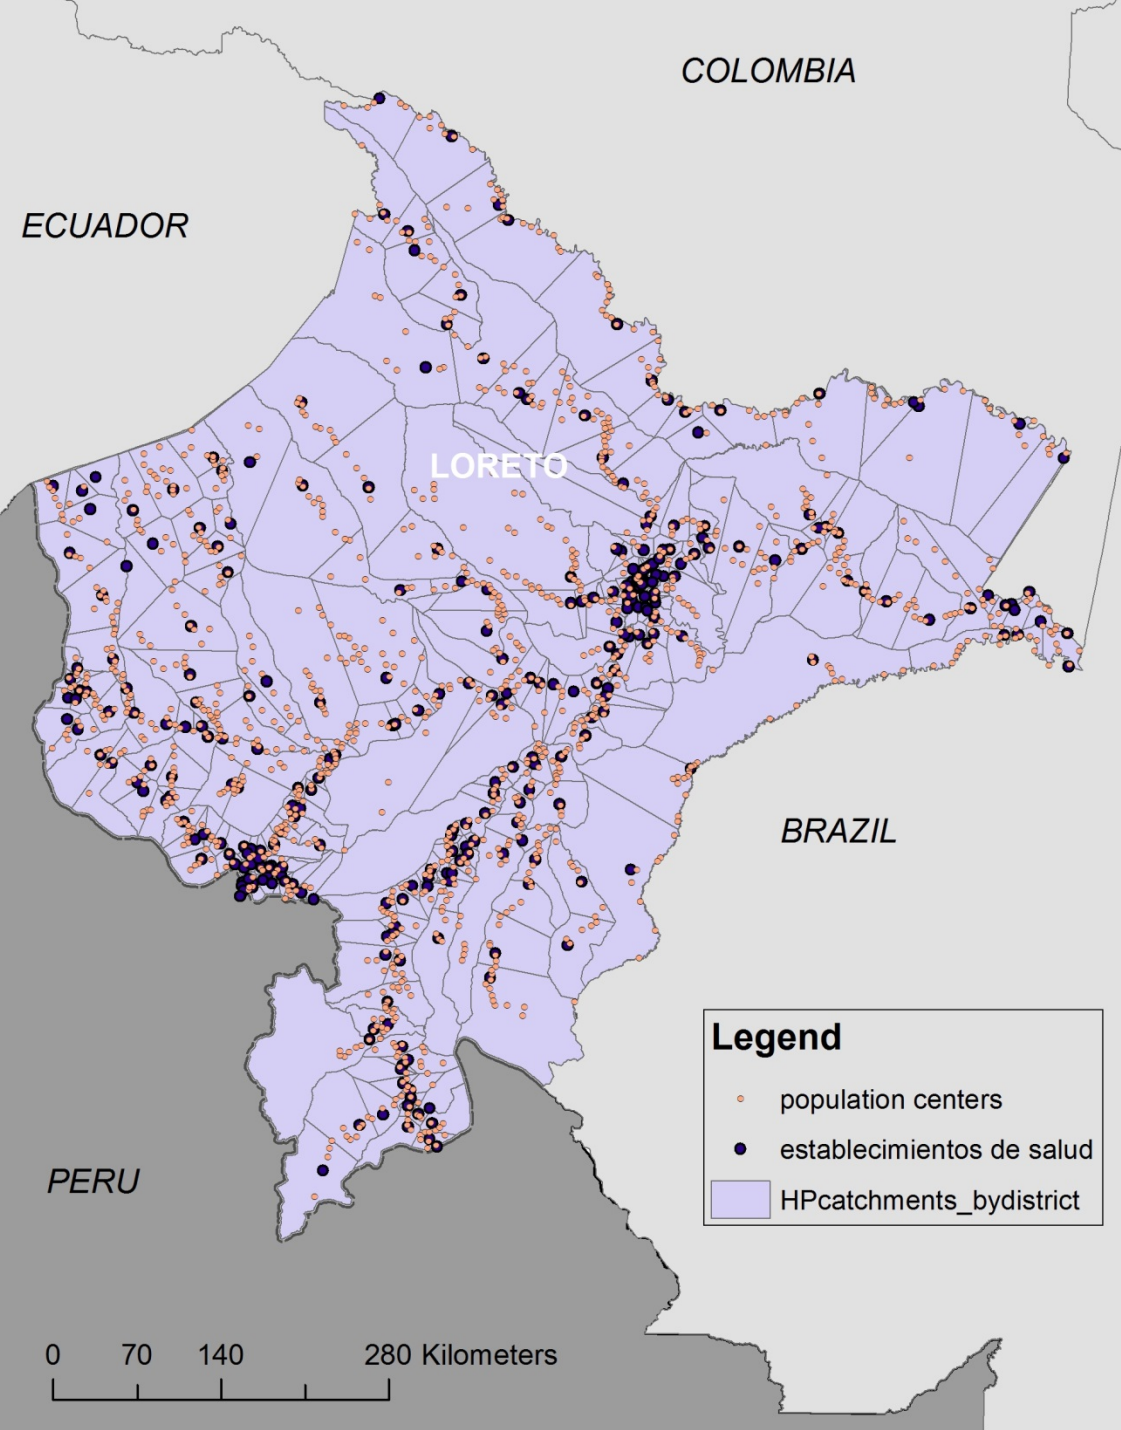

Extended LDAS Simulations

INTEGRATING CLIMATE AND SURVEILLANCE DATA

Graphs by year

TIMELINE AND BUDGET

- Total budget: \$136K
- Budget Received: \$61K*
- Spent: \$62K*
- Spent + Committed: \$83K*
- A no-cost extension has been approved

* August 2012 figures

NEXT STEPS

- Complete evaluation and refinement of species-specific mosquito model
- Finalize population level malaria risk model
- Work with end-user partners to ensure that the products are taking on a useful form
- Ensure further development of the feasibility study (W. Pan NIH R01 proposal submitted July 2012)

THANK YOU
